Lecture 2: Java Language Foundations I

CONTENTS OF THIS LESSON

- > Syntax
- **>** Output
- **>** Comments
- ➤ Variables
- ➤ Operators
- > Strings
- > Math

Java Syntax

- In Java, every line of code muse be inside class **Main**.
- The main() method is required and any code inside the main() method will be executed.
- Every Java program has a class name that must match the filename. Every program must contain the main() method.

```
public static void main(String[] args)
```

System.out.println()

Inside the main() method, the println() method can be used to print a line of text, as presented as below:

```
public static void main(String[] args) {
   System.out.println("Hello World");
}
```

Note:

- -The beginning and the end of a block of code should have the curly braces { }
- -System is a built-in Java class that contains useful members, such as output.
- -println()method represents "print line" and is used to print a result.
- -Each code statement must end with a semicolon.

Java Output

```
You can print out more results, using println() method.

public static void main(String[] args) {
```

```
public static void main(String[] args) {
    System.out.println("Hello World");
    System.out.println("Monday");
}
```

You also can do mathematical calculations.

```
System.out.println(3 + 3);
```

print()method will not add a line.

```
public static void main(String[] args) {
   System.out.print("Hello World");
   System.out.print("Monday");
   System.out.print(1+7);
}
```

```
Hello World

Monday

...Program finished with exit code 0

Press ENTER to exit console.
```

```
Hello WorldMonday8
...Program finished with exit code 0
Press ENTER to exit console.
```

Java Comments

Single-line Comments

- Single-line comments start with two forward slashes //.
- Single-line comment can be used before a code line.
- Single-line comment can be used at the end of a code line.

```
// This is a comment
System.out.println("Hello World"); // This is a comment
```

Multi-line Comments

- Multi-line comments start with /* and ends with */.

```
/* The code below will print the words Hello Worldto the screen, and it is amazing */
System.out.println("Hello World");
```

Java Variables

Variables: containers for storing data values

Types of variables:

String – stores text. String values are surrounded by double quotes. Eg. "Hello".

int – stores integers. Eg. 87

float – stores floating point numbers. Eg. 453.89

char – stores single characters. Eg. 'e'. (Note: Char values are surrounded by single quotes)

boolean – stores values with two states: true or false Declaring Variables: Specify the variable type and assign a value for it.

Syntax:

```
type variableName = value;
```

```
public class Main
    public static void main(String[] args) {
        int num1;
        num1 = 34;
       String text = "Hello World";
        float myFloatNum = 5.99f;
       char letter = 'D';
        boolean myBool = true;
              ..out.println(num1);
        System.out.println(text);
        System.out.println(myFloatNum);
        System.out.println(letter);
        System.out.println(myBool);
```

```
34
Hello World
5.99
D
true
...Program finished with exit code 0
Press ENTER to exit console.
```

Q: What will be the result?

```
int myNum = 15;
myNum = 20; // myNum is now 20
System.out.println(myNum);
int x = 5;
int y = 6;
System.out.println(x + y); // Print the value of x + y
String name = "John";
System.out.println("Hello " + name);
String firstName = "John ";String lastName = "Doe";
String fullName = firstName + lastName;
System.out.println(fullName);
```

Tips:

- •For numeric values, + character works as a mathematical operator.
- + character can be used to combine both text and a variable.
- + character can add a variable to another variable.

The rules for variable name:

- Names must begin with a lowercase letter or characters, such as \$ and _.
- Names are case sensitive. (Eg. "myNum" and "mynum" are different variables).
- Reserved words (Java keywords), such as int or boolean, cannot be used as name.

Java Operators

Types of operators in Java:

- Arithmetic operators used to perform common mathematical operations.
- Assignment operators used to assign values to variables.
- Comparison operators used to compare two values.
- Logical operators used to determine the logic between variables or values.
- Bitwise operators used to perform the manipulation of individual bits of a number.

Arithmetic operators

| Operator | Name | Description | Example |
|----------|----------------|--|---------|
| + | Addition | Adds together two values | x + y |
| - | Subtraction | Subtracts one value from another | x - y |
| * | Multiplication | Multiplies two values | x * y |
| / | Division | Divides one value by another | x / y |
| % | Modulus | Returns the division remainder | x % y |
| ++ | Increment | Increases the value of a variable by 1 | ++X |
| | Decrement | Decreases the value of a variable by 1 | X |

Assignment Operators

| Operator | Example | Same As |
|----------|---------|-----------|
| = | x = 5 | x = 5 |
| += | x += 3 | x = x + 3 |
| -= | x -= 3 | x = x - 3 |
| *= | x *= 3 | x = x * 3 |
| /= | x /= 3 | x = x / 3 |
| %= | x %= 3 | x = x % 3 |

```
int x = 10;
x %= 5;
System.out.println(x);

int x = 10;
x /= 5;
System.out.println(x);
```

Comparison Operators

| Operator | Name | Example |
|----------|--------------------------|---------|
| == | Equal to | x == y |
| != | Not equal | x != y |
| > | Greater than | x > y |
| < | Less than | x < y |
| >= | Greater than or equal to | x >= y |
| <= | Less than or equal to | x <= y |

```
public static void main(String[] args) {
  int x = 10;
  float y = -35.55f;
  System.out.print(x<y);
}</pre>
```

```
false
...Program finished with exit code 0
Press ENTER to exit console.
```

Logical Operators

| Operator | Name | Description | Example |
|----------|-------------|---|--------------------|
| && | Logical and | Returns true if both statements are true | x < 5 && x < 10 |
| П | Logical or | Returns true if one of the statements is true | x < 5 x < 4 |
| ! | Logical not | Reverse the result, returns false if the result is true | !(x < 5 && x < 10) |

```
int x = 8;
System.out.println(x<5&&x<10);

double x = 4.5;
System.out.println(x<5||x<4);</pre>
```

Java Strings

String methods

```
Method
                   Function
length()
                   To find the length of a string
                   To convert all the characters in a string to
toUpperCase()
                   uppercase
                   To convert all the characters in a string to
toLowerCase()
                   lowercase
                   To return the index of the first occurrence of
                   a specified text in a string
indexOf()
String txt = "ABCDEFGHIJKLMNOPQRSTUVWXYZ";
System.out.println("The length of the txt string is: " + txt.length());
String txt = "Hello World";
System.out.println(txt.toUpperCase());
System.out.println(txt.toLowerCase());
String txt = "Please locate where 'locate' occurs!";
System.out.println(txt.indexOf("locate"));
```

String Concatenation

concat() method can be used to concatenate two strings

```
String firstName = "John ";String lastName = "Doe";
System.out.println(firstName.concat(lastName));
```

Adding number and string

```
String x = "10";String y = "20";
String z = x + y;  // z will be 1020 (a String)

String x = "10";int y = 20;
String z = x + y;  // z will be 1020 (a String)
```

Special Characters

| Escape character | Result | Description |
|------------------|--------|--------------|
| \' | 1 | Single quote |
| \" | 11 | Double quote |
| \\ | \ | Backslash |

String txt = "We are the so-called \"Wild Wine\" from the north. It\'s alright.\\";

Java Math

Java Math Class

| Math Class | Function |
|---------------|--|
| Math.max(x,y) | To find the highest value between x and y. |
| Math.min(x,y) | To find the lowest value between x and y. |
| Math.sqrt(x) | To calculate the square root of x. |
| Math.abs(x) | To get the absolute value of x. |
| Math.random() | To return a random number between 0.0 (inclusive) and 1.0 exclusive) |

```
int randomNum = (int)(Math.random() * 101); // 0 to 100
```

Q: How to find the highest value/ lowest value among multiple values using Java?

Thank you! Any questions?
